

Your public cloud. Automatically optimized.

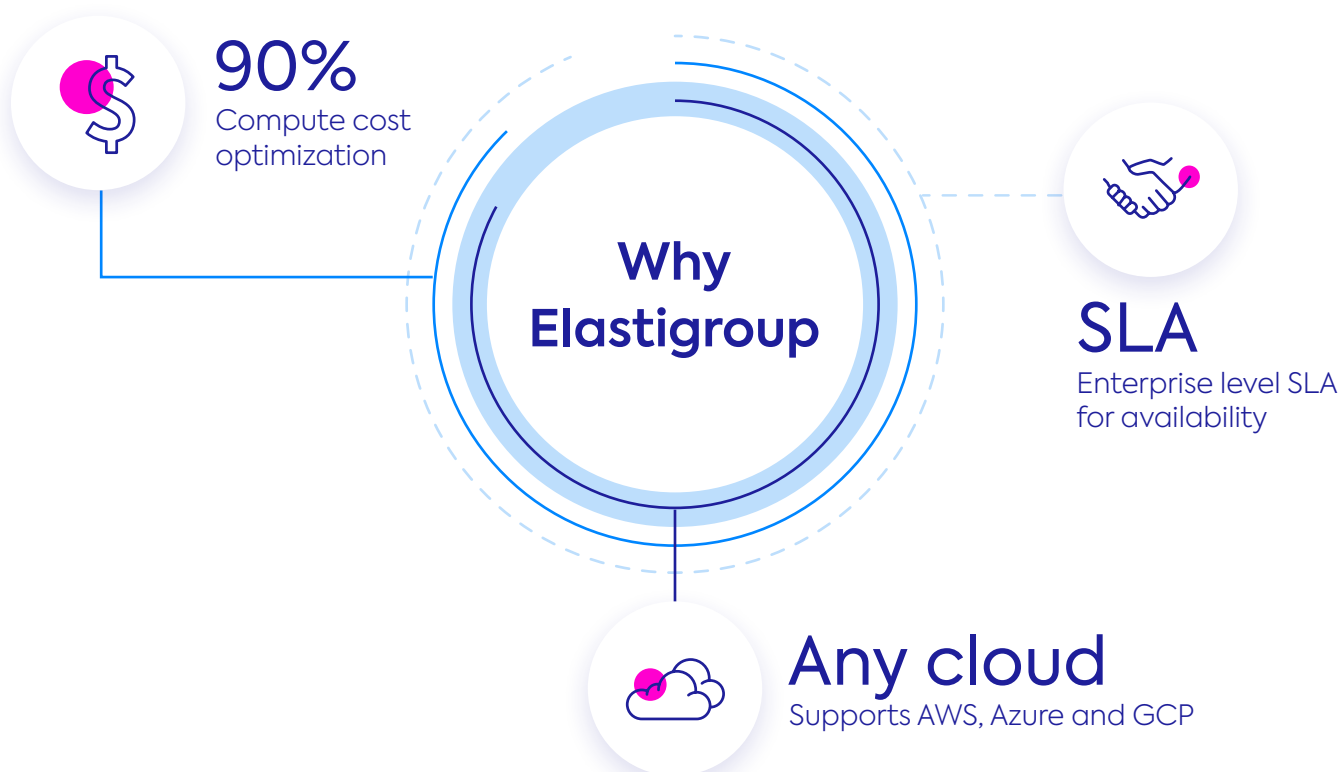

Application availability and scalability at up to 90% lower cost.

Elastigroup predicts spot instance behavior, capacity trends, pricing, and interruption rates so you can enjoy optimized pricing for even your production and mission-critical workloads. Whenever there's a risk of interruption, Elastigroup proactively acts to balance capacity well in advance, ensuring application availability with data-driven selection of the best replacement instances, including optional fallback to on-demand.

We've saved 65% of our compute cost and simplified our operations by taking a hands-off approach to managing our workloads and infrastructure using Spot.

What Elastigroup can do for you

Advanced pricing options strategies

Elastigroup runs your clusters on the perfect blend of compute pricing models, including spot, reserved and on-demand instances, while maintaining ideal cluster performance.

Automated backups

Frequent snapshots can be enabled to create machine image backups for launching a new instance. Fully backed-up storage volumes can be automatically re-attached to replacement instances, all reducing the impact of potential errors.

Advanced auto-scaling

Elastigroup provides advanced auto-scaling for your applications. Using metric-based and event-driven triggers, Elastigroup will always make sure that you have the optimal mix of right-sized VMs, available for your workload.

Data and IP persistence

Never lose a "bit" in the event of instance replacement. Immediately restart after a disruption, in any zone, from the same exact data point, maintaining root and data volumes as well as private and public IPs.

Visibility and monitoring

Elastigroup delivers deep visibility and monitoring into the activity of your clusters with real-time views of actual and projected infrastructure costs. Insight into cluster CPU, memory, and breakdown of instances running as RIs, on-demand, and spot, gives you the knowledge and control you need.
